

Statistics for the SDGs - indicators for national priorities

Name of the indicator	14.1.a Proportion of fish stocks within biologically sustainable levels
Sustainable Development Goal	Goal 14. Life below water
Priority	Effective and sustainable exploitation of marine resources for different social and economic purposes, while ensuring conservation of non-renewable resources natural process for the present and future generations; ensurance of coordination of entities' activities and methods of sea exploitation, coherent management of sea and coastal areas, including the Baltic Sea resources
Definition	<p>The indicator specifies amount of resources in the world and a share of fish stocks on biologically renewable level (Safe Biological Limits, SBL). When assessing the resources are classified into three categories: overexploited, fully exploited and under-exploited. The proportion of fish stocks within safe biological limits (i.e. greater than threshold biomass with biomass stocks, calle in relation to the number of stocks fully exploited and under-exploited; the indicator includes those stocks for which biomass threshold sets. The indicator determines the level of progress towards the sustainable management of fish stocks, in which the aim is to avoid overfishing and to maintain in a secure environmentally limits the effect of fishing on stocks, species and ecosystems.</p>
Unit	percent [%]
Available dimentions	<ol style="list-style-type: none"> 1. proportion of stocks fully exploited on the Baltic Sea 2. proportion of stocks non-fully exploited on the Baltic Sea 3. proportion of stocks over-exploited on the Baltic Sea 4. proportion of stocks within sustainable biological limits on the Baltic Sea
Methodological explanations	<p>The United Nations Convention on the Law of the Sea, to which the Union is a party, imposes obligations related to the protection, including maintenance or restoration of the population of the fished species at levels that the Maximum Sustainable Yield (MSY).</p> <p>Maximum Sustainable Yield is understood as the largest catch that can be taken from fish stocks for an period. The aim of this threshold is to achieve maximum efficiency of fish stocks while maintaining biodiversity and functioning of ecosystems relevant to present and future generations. Fish stocks are considered to be sustainable if their numbers persist at a level that ensures maximum sustainable yield or higher.</p> <p>In order to ensure that basic industrial species in the Baltic Sea are operated at a renewable level, Regulation (EU) No 2016/1139 of the European Parliament and of the Council of 6 July 2016 has been drawn up and adopted establishing a multiannual plan for cod, herring and sprat in the Baltic Sea and the fisheries exploiting those stocks (amending Council Regulation (EC) No 2187/2005 and repealing Council Regulation (EC) No 1098/2007).</p> <p>This regulation specifies the maximum level of fishing (maximum sustainable yield) of the species in question by imposing conservation obligations, including maintaining or restoring populations of target species at renewable levels.</p> <p>The indicator adopts four dimensions, i.e. : <ol style="list-style-type: none"> 1. proportion of fully exploited fish stocks 2. proportion of fish stocks not fully exploited 3. proportion of fish stocks over-exploited) and 4. proportion of stocks within sustainable biological limit </p> <p>Sustainable levels include those fish stocks which, according to the stock assessment,</p>

Statistics for the SDGs - indicators for national priorities

	<p>were classified as "not fully exploited" and "fully exploited". The indicator is calculated as the sum of these two categories divided by the total number of fish species subject to resource assessment and multiplied by 100.</p> <p>The assessment of stocks includes fish stocks as defined in Regulation (EU) No 2016/1139 of the European Parliament and of the Council for which a multi-annual plan has been established:</p> <ol style="list-style-type: none"> 1. Atlantic cod in the western part of the Baltic Sea 2. Atlantic cod in the eastern part of the Baltic Sea 3. Atlantic herring in the western part of the Baltic Sea 4. Atlantic herring in the central part of the Baltic Sea 5. sprat in the Baltic Sea
Data source	Ministry of Agriculture and Rural Development
Data availability	Annual data; since 2010
Notes	Since 2012, the value of the percentage share is based on the analysis of 4 stocks (excluding the eastern cod stock).
