Statistics for the SDGs - global indicators

Name of the indicator	**9.4.1 CO 2 emission per unit of value added**
Sustainable Development Goal	'Goal 9. Industry, Innovation and Infrastructure'
Target	9.4 By 2030, upgrade infrastructure and retrofit industries to make them sustainable, with increased resource-use efficiency and greater adoption of clean and environmentally sound technologies and industrial processes, with all countries taking action in accordance with their respective capabilities
Definition	The indicator determines the amount of carbon dioxide (CO2) in kg per one unit of gross value added of Gross Domestic Product (2010=100). The indicator CO2 emission per unit of value added is currently being measured by CO2 emission per GDP PPP (Purchasing Power Parity).
Unit	kg CO2 / 2010 USD PPP
Available dimensions	total
Methodological explanations	**Emission** means the direct or indirect introduction, as a result of human activity, of the following factors into the air, water, soil or land: a) substances, b) energies, such as heat, noise, vibration or electromagnetic fields. **Gross value added (GVA)** in the gross domestic product account, is the difference between gross output and intermediate consumption. GVA indicates the input of individual producers, industries and sectors to the GDP creation. **Carbon dioxide (CO2) emission per unit of value added** is a universal indicator for measuring the impact of industrial production on environment. It captures the intensity of energy use, energy efficiency of production technology and most importantly use of fossil fuels.
Data source	International Energy Agency
Data availability	Annual data; since 2010.
