

Statistics for the SDGs - global indicators

Definition Number of new HIV infections per 100 thous. uninfected population. Unit Persons Available dimensions total Human Immunodeficiency Virus (HIV) - the human immunodeficiency virus that attacks, weakens and destroys the body's immune system, resulting in the loss of human ability to fight various diseases and infections. HIV is transmitted: • by blood, • through sexual contact, • from an infected mother to a child (the child may be prevented from damaging the mother during pregnancy, childbirth or breast-feeding). The indicator is calculated on the basis of the MZ-56 report on contagious diseases, infections and intoxication, and MZ-57 reports of contagious diseases by sex, age, place of residence and seasonality. Data concern new HIV infections, which according to the International Statistical Classification of Diseases and Health Problems ICD-10 are classified under the disease symbol: • Z21 as an asymptomatic state of HIV infection • and B20-B24: • B20 - Disease caused by the human immunodeficiency virus [HIV], which results in infectious and parasitic diseases, • B21 - Disease caused by the human immunodeficiency virus [HIV], which results in other specified diseases, • B23 - Disease caused by the human immunodeficiency virus [HIV], which results in other specified diseases, • B23 - Disease caused by the human immunodeficiency virus [HIV], which results in other states, • B24 - Disease caused by the human immunodeficiency virus [HIV]. Not specified. Data source Data availability Annual data Since 2010.	Name of the indicator	3.3.1 Number of new HIV infections
diseases and combat hepatitis, water-borne diseases and other communicable diseases	-	Goal 3. Good health and well-being
