

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	13.A.1 Emissions of carbon dioxide from plants especially noxious to air purity per capita
Sustainable Development Goal	Goal 13. Climate action
Priority	Effective reduction of CO2 concentration in the atmosphere
Definition	Total mass of carbon dioxide emitted per inhabitant from particularly burdensome plants in the surveyed year (as of 30 June of the surveyed year).
Unit	tonne
Available dimensions	total
Methodological explanations	Plants particularly burdensome for air cleanliness are so-called point sources of pollutant emissions, which include all organizational units determined by the then Minister of Environmental Protection and Natural Resources on the basis of a certain amount of fees paid in 1986 for the annual emission of air pollutants at the rates specified in the Regulation of the Council of Ministers of 13 January 1986 on fees for the economic use of the environment and introducing changes thereto (Journal of Laws No. Journal of Laws No 7, item 40, as amended). The set of reporting entities (establishments) established in this way is maintained annually, which, among other things, ensures continuity and comparability of audit results. This grouping may be increased only in special cases, e.g. by units newly launched or extended with a high threshold scale of pollutant emissions. Emission of air pollutants - release of dust and gaseous pollutants into the atmosphere in the organized (through stationary point-sources) or unorganized manner (from dumps, landfills, during reloading of loose or volatile substances, through roof and window ventilation, due to forest fires, etc.).
Data source	Statistics Poland / Chief Inspectorate of Environmental Protection / Ministry of Climate and Environment
Data availability	Annual data, since 2010
