

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	6.A.1 Exploitable underground water resources [hm ³]
Sustainable Development Goal	Goal 6. Clean water and sanitation
Priority	Activities aimed at achieving high water quality, availability of its resources and its protection
Definition	The amount of total exploitable underground water resources expressed in cubic hectometers per year.
Unit	hm ³
Available dimensions	total
Methodological explanations	Underground waters – water appearing in the rocks of the earth. Depending on the depth of occurrence of groundwater aquifers and the distribution of structures and the surrounding works are distinguished: subsurface water, ground water, underground waters, deep waters. Exploitable resources of underground water intakes – the amount of underground water that can be withdrawn from an intake under given hydrological, technical and economic conditions, taking into account the demand for water and maintaining environmental protection requirements. Data as of 31 December.
Data source	Polish Geological Institute – National Research Institute
Data availability	Annual data, since 2010
