

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	6.D.9 The difference between the percentage of the population using water and sewage systems in urban areas
Sustainable Development Goal	Goal 6. Clean water and sanitation
Priority	Development of water and sewage infrastructure
Definition	The difference between the percentage of the population living in urban areas using the water supply network and the percentage of the population living in urban areas using the network sewerage system.
Unit	percentage points
Available dimensions	total
Methodological explanations	The indicator value is the result of subtracting the values of the following two indicators: Percentage of population using water systems in cities in the total population living in cities areas (minus) and Percentage of population using sewage systems in cities areas in the total population living in cities areas (minus). Data on using water include the population living in cities areas in residential buildings and in collective dwellings connected to the using water systems. Data on the use of sewage systems include the population living in cities areas in residential buildings and in collective dwellings connected to the sewage systems.
Data source	Statistics Poland
Data availability	Annual data, since 2010
