

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	14.D.1 Carrying capacity of the maritime transport fleet
Sustainable Development Goal	Goal 14. Life below water
Priority	Management of marine areas and resources of the Baltic Sea at various levels of partnership, in particular the research and scientific sector
Definition	Total cargo capacity of all transport vessels registered in Polish ports or operated in Polish maritime trade, expressed in gross deadweight tonnage (DWT).
Unit	thous. tonnes
Available dimensions	total
Methodological explanations	Maritime transport fleet - vessels used to transport cargo and passengers at sea. Deadweight tonnage (DWT) - the weight of cargo and stores at summer loadline draft in seawater, expressed in tonnes (1,000 kg). The difference in tonnes between the displacement of a vessel at summer loadline draft in water with a specific gravity of 1.025 t/m³ and the total weight of the vessel, i.e., the displacement of the vessel in tonnes without cargo, fuel, lubricating oil, ballast, fresh water and drinking water in tanks, utility items, as well as passengers, crew, and their belongings.
Data source	Statistics Poland
Data availability	Annual data, since 2017
Notes	Data are presented by the location of the enterprise's registered office, i.e. they are allocated to the territorial unit where the registered office of the enterprise is located, regardless of the place where the economic activity is actually carried out.
