

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	6.D.8 Number of household independent wastewater treatment systems
Sustainable Development Goal	Goal 6. Clean water and sanitation
Priority	Development of water and sewage infrastructure
Definition	Number of household wastewater treatment systems.
Unit	-
Available dimensions	total
Methodological explanations	Household independent wastewater treatment systems is a complex of devices intended for treatment of sewage produced in one or more households. As a result of an anaerobic and aerobic decomposition occurring in that system, the larger part of sewage is converted into the form of water of second class quality that can be safely discharged into the ground or nearby surface waters (rivers, streams, ditches, ponds, lakes). A household sewage treatment plant consists of a primary settling tank and a final treatment system. Depending on the type of the final treatment system there are household sewage treatment plants with: Data on the number of household independent wastewater treatment systems as of 31 December.
Data source	Statistics Poland
Data availability	Annual data, since 2010
