

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	13.D.2 Share of particulates pollutants retained or neutralised in pollutant reduction systems in percent of pollutants generated
Sustainable Development Goal	Goal 13. Climate action
Priority	Increasing the region's resilience to the effects of climate change
Definition	Share of particulate pollutants retained or neutralised in pollution abatement equipment in total generated pollutants.
Unit	percent
Available dimensions	total
Methodological explanations	Particulate pollutant emissions – the introduction into the atmosphere emissions into the atmosphere particulate fragmentation macroscopic and colloidal whose concentration exceeds the average content of these substances in the clean air, negatively impacting on human health and the condition and quality of the environment. Particulate pollutants retained or neutralized in purification devices - the amount of particulate pollutants reduced in end-of-pipe devices used to protect the atmosphere. End-of-pipe equipment – equipment that deals with the disposal and reduction of already generated pollutants. They do not affect the production process (production can be carried out without these devices), but reduce or eliminate pollution after their production (e.g. sewage treatment plant, landfill). Expenditure on such projects, in accordance with the methodology recommended by EUROSTAT, is fully allocated to environmental protection.
Data source	Statistics Poland / Chief Inspectorate of Environmental Protection / Ministry of Climate and Environment
Data availability	Annual data, since 2010
