

Statistics for the SDGs - indicators for national priorities

Name of the indicator	11.6.b Share of pollutants retained or neutralised in pollutant reduction systems in plants particularly noxious in cities with powiat status
Sustainable Development Goal	Goal 11. Sustainable cities and communities
Priority	Improving air quality by reducing "low emission" (i.e. up to 40 m AGL) i.a. from domestic boiler houses and road transport
Definition	The indicator expresses the percentage ratio of pollutants retained to pollutants generated (i.e. retained and emitted) in cities with powiat status. Its value may range from 0 to 100%. The closer the value is to 100%, the greater the pollution control potential of a given emission source.
Unit	percent [%]
Available dimentions	type of pollutants: gaseous (without CO2), particulate
Methodological explanations	Data on the quantity of retained and neutralised gaseous and particulate pollutants describe the volume of emissions reduced by air pollution abatement equipment installed in plants classified as significant sources of air pollution. The efficiency of such equipment, expressed as the degree of pollutant reduction, is a characteristic parameter indicating the percentage of the total amount of a given pollutant entering the equipment that is retained by it. The actual efficiency of the air pollution abatement equipment is equal to or lower than the expected operational efficiency, as it reflects operating conditions (e.g. the chemical composition of the flowing dust and gases, particle size distribution of dust, gas flow rate, temperature, humidity and pressure of the gas, among others), as well as its operational availability. Plants classified as significant sources of air pollution are referred to as point sources of pollutant emissions, and include organisational units identified by the then Minister of Environmental Protection and Natural Resources on the basis of the level of fees paid in 1986 for annual emissions of air pollutants, according to the rates specified in the Regulation of the Council of Ministers of 13 January 1986 on fees for economic use of the environment and its modification (Journal of Laws No. 7, item 40, as amended). The resulting population of reporting units (plants) is maintained on an annual basis, which ensures continuity and comparability of survey results. This population may be modified only in exceptional cases, for example by adding newly established units or expanded units exceeding defined emission thresholds.
Data source	Statistics Poland
Data availability	Annual data, since 2010
