

Statistics for the SDGs - indicators for national priorities

Name of the indicator	9.4.a Length of railway line per 100 km ²
Sustainable Development Goal	Goal 9. Industry, Innovation and Infrastructure
Priority	Development of transport infrastructure
Definition	Density of total railway lines per 100 km ² area.
Unit	km
Available dimensions	total
Methodological explanations	The basis for the calculation of the indicator is the total length of railway lines operated on 31 December. A railway line is an element of the railway network between two junction stations (or terminal stations). The length of operated railway lines is the sum of the construction length of standard gauge, narrow gauge and large gauge railway lines operated on 31 December. The construction length of railway line is understood as the distance between its extremes measured on single-track lines – along the axis of the track, and on multi-track lines – along the axis of the longest track.
Data source	Statistics Poland
Data availability	Annual data, since 2010
