

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	3.E.9 Number of Lyme disease cases per 10 thous. population
Sustainable Development Goal	Goal 3. Good health and well-being
Priority	Development of health prevention and rehabilitation and health promotion
Definition	Lyme disease cases per 10 thousand population.
Unit	persons
Available dimensions	total
Methodological explanations	Morbidity is the frequency of new cases of a disease in a studied population. Lyme disease (Latin: borreliosis, morbus Lyme) is a multisystemic infectious disease caused by bacteria belonging to spirochetes. The most common genospecies that are the etiological factor are: <i>Borrelia burgdorferi sensu stricto</i>, <i>Borrelia garinii</i> and <i>Borrelia afzelii</i>, transmitted to humans and some animals by ticks of the genus <i>Ixodes</i>. Human infection occurs after the tick bites and feeds on the skin. The reservoir of the spirochete is numerous species of animals, mainly rodents.
Data source	Statistics Poland
