

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	13.C.2 Emissions of air pollutants from plants especially noxious to air purity per 1 km ²
Sustainable Development Goal	Goal 13. Climate action
Priority	
Definition	Total mass of particulate pollutants from particularly burdensome plants emitted in the surveyed year per 1 km ² of area.
Unit	tonne
Available dimensions	total
Methodological explanations	Plants particularly burdensome for air cleanliness are so-called point sources of pollutant emissions, which include all organizational units determined by the then Minister of Environmental Protection and Natural Resources on the basis of a certain amount of fees paid in 1986 for the annual emission of air pollutants at the rates specified in the Regulation of the Council of Ministers of 13 January 1986 on fees for the economic use of the environment and introducing changes thereto (Journal of Laws No. Journal of Laws No 7, item 40 as amended). The set of reporting entities (establishments) established in this way is maintained annually, which, among other things, ensures continuity and comparability of audit results. This grouping may be increased only in special cases, e.g. by units newly launched or extended with a high threshold scale of pollutant emissions. Particulate pollutant emissions – the introduction into the atmosphere of solid particles with macroscopic and colloidal fragmentation, the concentration of which exceeds the average content of these substances in clean air, adversely affecting human health and the state and quality of the environment.
Data source	Statistics Poland / Chief Inspectorate of Environmental Protection / Ministry of Climate and Environment
Data availability	Annual data, since 2010
