

Statistics for the SDGs - indicators for regional priorities

Name of the indicator	7.A.1 Electricity generated from renewable sources
Sustainable Development Goal	Goal 7. Affordable and clean energy
Priority	
Definition	Ratio of the sum of electricity production from power stations: hydroelectric power station, wind power stations, and electricity produced from biomass, biogas, biofuels (including their co-firing) to total electricity production.
Unit	percent
Available dimensions	total
Methodological explanations	Energy from renewable sources is the energy derived from natural, repetitive environmental processes, obtained from renewable non-fossil energy sources (energy: water, wind, solar heat, geothermal heat, waves, sea currents and tides and energy obtained from biomass, biogas, biofuels). In domestic conditions, energy from renewable sources comprises energy obtained from direct use of solar heat, wind, geothermal resources (from the Earth), water and energy generated from biomass, biogas, biofuels. Electricity gross generation - energy transformations output in the form of electrical current, as measured on generator contacts.
Data source	Statistics Poland
Data availability	Annual data, since 2010
