

Statistics for the SDGs - indicators for national priorities

Name of the indicator	6.1.c Percentage of uniform surface water bodies with good status
Sustainable Development Goal	Goal 6. Clear water and sanitation
Priority	Increase in disposable water resources, improvement of its ecological state and chemical quality
Definition	Share of surface water bodies (SWBs) of rivers, dam reservoirs and lakes classified as being in Good Status, in the total number of SWBs in the respective category.
Unit	percent [%]
Available dimensions	surface water category
Methodological explanations	A surface water body (SWB) is a discrete and significant element of surface waters such as a lake, reservoir, stream, river or canal, a section of a stream, river or canal, transitional waters, coastal water bodies, as well as dam reservoirs. Dam reservoirs are formed by the impoundment of river water; therefore, after the completion of their intended functions, efforts should be made to restore their natural state, which is a river. Moreover, they are not entirely artificial reservoirs, unlike, for example, excavations. Consequently, dam reservoirs are classified as heavily modified river surface water bodies. The status of river and lake surface water bodies is assessed as good or poor by analysing the results of classification of their ecological status or ecological potential (based on the results of measurements of water quality indicators comprising physicochemical, biological and hydromorphological elements). Ecological status is determined for natural surface water bodies, whereas ecological potential is determined for waters that are artificial or heavily modified due to human activity. Information on the status of surface waters (rivers, lakes, transitional and coastal waters) is obtained within the framework of water quality monitoring, which is a subsystem of the State Environmental Monitoring system. Water quality monitoring is carried out by the Chief Inspectorate of Environmental Protection on the basis of designated surface water bodies, which constitute the basic water management unit.
Data source	Chief Inspectorate of Environmental Protection
Data availability	Annual data; for the period 2015–2019, and for 2021 and 2024
